SEAT RESERVATION APP

DO YOU!?

4GIFs.com

INSTRUCTIONS

Complete the seat reservation app by using JavaScript to make it interactive.

- Users should be able to choose an available seat to reserve and enter their information into a form.
- Submitting this form should create an object that represents that user and is associated with that seat.
- Use jQuery selectors and actions in your JavaScript.

Break up the tasks among group members. Each person should push their own changes to the repo.

BONUS!

- On hover (for reserved seats), make the associated user's information appear on the screen.
- Go back and refactor the work you've already done once you've gotten the basic functionality worked out! How can you DRY up your code?

Reservation Name Seat

FIGURE IT OUT

Create a form with at least five separate inputs. Hide all but the first and show the rest only when the previous input is in focus.
